Contact Organics Weed Terminator

Performance Validation at Harvard University

Harvard University Landscape Services has implemented a sustainable landscape management program that encourages the systems created by nature: healthy soils supporting healthy plants.

A comprehensive performance validation of Contact Organics Weed Terminator was conducted by Harvard University Landscape Services at Harvard University Campus on June 15, 2022

Performance validation on very large, mature weeds at the Harvard University Landscaping Yard

Validation Summary and Observations

Contact Organics Weed Terminator delivered superior weed control performance, already within one day of spraying.

Weed Terminator will continue its desiccation process typically for one week.

Most of the weeds are killed already. Our experience is that everything that looks grey green after a couple of hours will not survive. The really woody weeds might survive at the used dilution level.

You will get some regrowth from seeds in the soil, grasses and big weeds with deeper roots. You would respray them after 2-3 weeks. Then you will have established full control.

Full cone nozzles will be provided to ensure optimum spray distribution and coverage.
